2.6. Role of Key Files.....	6
2.7. Configuring Django Settings .....	9
2.8. Creating and Managing Django Apps .....	9

# Week 1: Django Basics (Days 1–6)

## 1. Day 1: Introduction to Django

### 1.1. What is Django? Why use Django?

### 1.2. Setting up a Django project

#### 1.2.1. Check if Python is Installed

Before installing Django, make sure Python is installed on your system.

For Windows, open Command Prompt (cmd) and run **python --version** or **python3 --version**.

If Python is not installed, download it from the official Python website and install it.

#### 1.2.2. Install pip (Python Package Manager)

##### For Windows:

Download the pip installer script from: **<https://bootstrap.pypa.io/get-pip.py>**

Go to the download directory and run the command:

**python get-pip.py**

**or python3 get-pip.py**

Find the Scripts directory inside the Python installation folder and add it to Environment Variables.

##### For Mac:

Run the following command to download the pip installer script:

**curl https://bootstrap.pypa.io/get-pip.py -o get-pip.py**

Execute the script using:

**python3 get-pip.py**

##### For Linux:

Install pip using:

**sudo apt-get install python3-pip python-dev**

Verify pip Installation:

Run the following command to check if pip is installed correctly:

**pip --version**

**or pip3 --version**

### 1.3. Installing and using a virtual environment

After successfully installing pip, the next step is to set up a **virtual environment** using **venv**. A virtual environment allows you to manage dependencies separately for each project, making it useful for deployment or transferring projects to another system.

#### Installing Virtual Environment

Run the following command to install **venv**:

- **pip install virtualenv**

Each project should have its own **venv** to maintain package isolation.

**To create virtual environment file:**

**python -m venv env**

#### Activating the Virtual Environment

- On Windows (Command Prompt or VS Code Terminal)
  - `\env_folder_name\Scripts\activate.bat`
  - `\env_folder_name\Scripts\activate`
- On Mac/Linux (Terminal)
  - `source venv_folder_name/bin/activate`

**Note:** If the activation does not work in **PowerShell**, open **Command Prompt** in VS Code and try again.

Generating packages on requirement.txt file:

**pip freeze > requirements.txt**

## 2. Day 2: Django Project Structure

### 2.1. Installation of Django on virtual environment

Once the virtual environment is activated, install Django using:

- **pip install django**

### 2.2. Creation of Django Project

To create a new Django project, run:

- **django-admin startproject** project\_name : blogapp

**Note: Replace project\_name with your preferred project name.**

### 2.3. Running the development server

Navigate to the project directory and start the Django server:

- `cd project_name`
- **python manage.py runserver**

### 2.4. Creating and exploring a Django app

Inside your project folder, create a Django app using:

- `python manage.py startapp app_name`

For example, to create an app for a **blog website**:

- **python manage.py startapp** blog
- **python manage.py startapp** blog # Handles blog posts
- **python manage.py startapp** users # Manages user authentication
- **python manage.py startapp** comments # Manages comments on blog posts
- **python manage.py startapp** categories # Manages categories for blog posts
- **python manage.py startapp** likes # Manages likes on blog posts and comments

### 2.5. Understanding Django's Folder Structure

After creating a Django project (**django-admin startproject** project\_name), the structure will look like this:

```

projectstructure.txt
1  project_name/
2  |— manage.py
3  |— project_name/
4  |   |— __init__.py
5  |   |— settings.py
6  |   |— urls.py
7  |   |— asgi.py
8  |   |— wsgi.py
9  |— app_name/
10 |   |— migrations/
11 |   |— __init__.py
12 |   |— admin.py
13 |   |— apps.py
14 |   |— models.py
15 |   |— tests.py
16 |   |— views.py
17 |— static/
18 |— templates/
19 |— db.sqlite3 #database_name
20

```

Each file serves a specific role:

- **manage.py**: A command-line utility for managing the Django project.
- **settings.py**: Configures settings like databases, middleware, installed apps, etc.
- **urls.py**: Defines URL patterns and routes to views.
- **wsgi.py / asgi.py**: Entry points for web servers (**Web Server Gateway Interface** (WSGI) for synchronous apps, **Asynchronous Server Gateway Interface** (ASGI) for async apps).
- **models.py**: Defines database models (tables).
- **views.py**: Contains functions or classes that handle requests and return responses.
- **admin.py**: Registers models to the Django admin panel.
- **apps.py**: Configures app settings.
- **migrations/**: Stores database migration files.

## 2.6. Role of Key Files

- **settings.py** (Configures Django Settings)

This file manages configurations like installed apps, middleware, databases, static files, etc.

```
≡ settings.txt
1  INSTALLED_APPS = [
2      'django.contrib.admin',
3      'django.contrib.auth',
4      'django.contrib.contenttypes',
5      'django.contrib.sessions',
6      'django.contrib.messages',
7      'django.contrib.staticfiles',
8      'blog',
9      'users',
10     'comments',
11     'categories',
12     'likes',
13 ]
14
15 DATABASES = {
16     'default': {
17         'ENGINE': 'django.db.backends.sqlite3',
18         'NAME': BASE_DIR / "db.sqlite3",
19     }
20 }
21
22 STATIC_URL = "/static/"
23
```

- **urls.py** (Defines URL Routing)

Maps URLs to views.

```
from django.contrib import admin
from django.urls import path, include

urlpatterns = [
    path('admin/', admin.site.urls),
    path('blog/', include('blog.urls')),
    path('users/', include('users.urls')),
]
```

- **models.py** (Defines Database Tables)

Used to create and manage database tables using Django ORM.

```
1  from django.db import models
2
3  # Create your models here.
4  class User(models.Model):
5      name = models.CharField(max_length=200)
6      email = models.EmailField()
7      created_at = models.DateTimeField(auto_now_add=True)
8
```

- **views.py** (Handles Business Logic)

Defines what happens when a user visits a particular URL.

```

1  from django.shortcuts import render
2  from django.http import HttpResponse
3
4  def home(request):
5      return HttpResponse("Welcome to my blog!")
6

```

## 2.7. Configuring Django Settings

Django settings can be modified inside settings.py. Common configurations include:

- Database Configuration

```

83  DATABASES = {
84      'default': {
85          'ENGINE': 'django.db.backends.postgresql',
86          'NAME': 'mydatabase',
87          'USER': 'myuser',
88          'PASSWORD': 'mypassword',
89          'HOST': 'localhost',
90          'PORT': '5432',
91      }
92  }

```

## 2.8. Creating and Managing Django Apps

- Creating an App

`python manage.py startapp app_name`

- Registering an App

```

INSTALLED_APPS = [
    'django.contrib.admin',
    'django.contrib.auth',
    'user',
]

```

- Creating Views

```
from django.shortcuts import render
from django.http import HttpResponse

def home(request):
    return HttpResponse("Welcome to my blog!")
```

- Creating URLs

```
1  from django.urls import path
2  from . import views
3
4  urlpatterns = [
5      path('', views.home, name='home'),
6  ]
7  |
```
